

Packaging

Pack all samples in a waterproof, air-tight and heavy duty container. Do not send any other objects along the sample (ex. Paraphernalia, pipes, sold packaging), otherwise we will *discard* your sample.

Feel free to use additional padding, packaging, envelopes, wrap or another non-porous container over the enclosed sample to ensure no degradation in transit. This is critical on substances active in the microgram range, as they are often susceptible to degradation within high heat and environments that encounter high exposure to UV light.

Quantities

Depending on the substance submitted to us for analysis, we have posted rough guidelines to how much should be sent to us and an amount that we can adequately test using our available technology.

Ecstasy Pills	1 (one) complete pill
MDMA	50 milligrams (0.05g)
LSD	1 (one) square or tab
Cannabis	1 (one) gram
Cocaine	50 milligrams (0.05g)
Other substances	No more than 500 milligrams (0.5g)

These amounts are what is recommended by us, we however, can test for even trace quantities. Do not submit any precursor materials or the raw form of lysergamides (along with potent opioids such as fentanyl etc.), if we suspect extremely volatile materials have been submitted to us, it will be disposed of before reaching analysis phase.

We are to publish more information on our website for what is the best way to submit cannabis for testing. As cannabinoid percentages vary throughout the plant features.
